1.0 Introduction

This memorandum serves to analyze the traffic impacts of the proposed Royal Pine Apartments Development (site) on the adjacent roadway system. This study was conducted to determine the future traffic impacts on the surrounding transportation system and if the proposed development will cause any significant operational or safety problems.

A traffic impact study (TIS) is required per the City of Colorado Springs (City), Engineering Criteria Manual, Appendix A (TIS Guidelines). The following existing intersections will be analyzed in this study:

1. Union Blvd/Royal Pine Dr. (signalized)
2. Royal Pine Dr/Site Access Drive (right in/out only)
3. Royal Pine Dr/Purple Plum Way (roundabout)
4. Royal Pine Dr/Pine Manor Dr (T-intersection)

2.0 Area Conditions

The site is generally located in the northwest corner of the interchange of Powers Blvd (CO-21, freeway) and Union Blvd (principal arterial). Access to the site will be on Royal Pine Drive, a three-lane collector street with center two-way left turn lane (TWLTL), from existing intersections 2 and 3 above. At the signalized intersection with Union Blvd, this street transitions to more like a divided arterial facility with raised median. These street classifications are per the City's Major Thoroughfare Plan. There are existing private local streets on the site which will be expanded/modified.

The existing land use of the site is vacant but has adjacent small commercial uses. These are the Pine Creek Veterinary Hospital and Alligator Allergy & Asthma. The adjacent land to the north and west are existing single family residential neighborhoods. Commercial and institutional uses are to the south and east including big box retail stores and a hospital.

This current submittal of the TIS contains new traffic data provided by the City, which was collected following the start of the current K-12 school year. The average daily traffic (ADT) data for Royal Pine Dr was collected for a full week from August 22-28. The weekday ADT was determined from an average of the Tuesday-Thursday counts (it was confirmed that Friday – Monday ADT was lower). The intersection turning movement data was collected on a Tuesday, Wednesday, and Thursday (September 5-7) for intersection #'s 1, 3, and 4 shown above. The city also provided traffic data that was previously collected for the adjacent residential streets and analyzed with this study. All traffic data reports are in the Appendix.

Existing traffic conditions are shown on traffic figures summarizing all traffic turning movements (see Appendix). Level of Service (LOS) Analysis for existing conditions are presented in Table 2a later in the report.

The existing traffic conditions are summarized by the following. The weekday ADT on Royal Pine Drive is 4,378 vehicles per day (vpd). The signalized intersection of Union/Royal Pine currently operates at LOS C. Union Blvd contains three through lanes in each direction plus separate right and left turn lanes. There is additional pavement to create dual left turn lanes in both directions if/when needed in the future. The single lane roundabout at Royal Pine/Purple Plum Way currently operates at LOS A. There are existing sidewalks on the adjacent streets that will be connected to proposed sidewalks within the site.

3.0 Proposed Development

The roughly 8 acre residential in-fill site is shown on conceptual site plan with vicinity map on Figure 1 in the Appendix. Currently, there are three existing uses within the overall development:

- Urgent Care Center/Medical Office Building – 14,800 sf
- Medical/Dental Office Building – 4,600 sf
- Animal Hospital/Veterinary Clinic – 6,000 sf

In addition to these existing land uses, the following land uses are proposed for the remaining undeveloped property:

- Apartments (Multi-family housing (low rise)
- Leasing Office/Clubhouse (resident use only)

Sight distance at the existing access points appears adequate and will be verified with the final site plans. Royal Pine Dr is posted at 30-mph.

4.0 Projected Traffic

Trip Generation:

Trip generation for the existing and proposed land uses was determined using the Trip Generation Manual, 11th Edition (2021) published by the Institute of Transportation Engineers. See Table 1 below for the calculation of the revised site trips. Based on full buildout of the overall site with the land uses described above, the development is estimated to generate 2,257 total weekday trips. Table 1 is also shown in the Appendix at larger size.

The previous Condition of Record on the approved Concept Plan for the overall development established a trip generation budget of 8,441 weekday trips. As noted above, the revised land uses generate significantly fewer trips (2,257 trips) than the maximum allowed (8,441 trips). Per Table 1, the proposed site is anticipated to generate 149 trips (57 in/92 out) in the morning

peak hour and 184 trips (101 in/83 out) in the evening peak hour. The previously submitted Trip Generation Comparison letter by Drexel Barrell & Co (June 2023) is included in the appendix.

¹Source: "Trip Generation" Institute of Transportation Engineers, 11th Edition, 2021; KSF = 1000 SF of gross floor area.

²This code accounts for apartments of various sizes with average of 2.72 residents per dwelling unit (DU). This is considered conservative for this site's mix of one, two, and three bedroom apartments.

³This is an estimated value based on a staff of 2 employees seeing potential residents. Clubhouse is restricted to site residents only.

Trip Distribution:

The projected distribution of site traffic is 80% to/from Union Blvd. More specifically regarding Union Blvd, 45% will be to/from the northeast (and mostly access Powers Blvd), 25% to/from the southwest, and 10% continuing across Royal Pine Drive with access to large commercial developments. The remaining distribution to/from the internal neighborhood as shown in Figure 3.

The site build out opening year is expected to be 2025 and a future horizon of 2045 were analyzed. This current submittal uses traffic counts from the current K-12 school year. Therefore, the previously used volume adjustment factors are no longer applied. Traffic growth factors for the site build out and 2045 traffic models are included in section 5.0 of this report. An associated Synchro V11 Traffic Software Model (synchro) was created for the years 2025 and 2045 with the trip generation/distribution from the site added to these models. The resulting intersection LOS values are in a separate column in Table 4. "AM & PM" refer to the morning and afternoon peak hour periods. Traffic Figures and synchro reports for this model are included in the Appendix.

5.0 Traffic Analysis

The current background traffic was discussed in section 2.0. The site build out is expected by 2025. Therefore the opening year background traffic is not much different than existing conditions. Please note that trips from the existing overall site uses are accounted for with the traffic counts recently collected and shown in Figure 2 in the Appendix.

The 2025 traffic conditions with site development have been analyzed in detail. 80% of site outbound trips exit the site via the existing roundabout and then are added to the southeast approach to the signalized intersection with Union Blvd. This six lane principal arterial street currently contains relatively low traffic volume, and can adequately handle the additional traffic. The inbound trips will follow the reverse pattern except most will utilize the right in/out access prior to the roundabout. The small amount of remaining trips are to/from the existing neighborhood along Royal Pine Drive. See Figures 3 and 4 in the Appendix.

The existing access intersections will all have acceptable LOS in all columns of Table 2a. All movements are LOS C or better. The 2025 total traffic conditions include only minor increases in delay and no changes in the LOS rating compared with existing conditions. For example, the signalized intersection's SE movements (outbound) had delay increases in 2025 and are shown in bold in Table 2a. The signal was modeled using the existing timings that were provided by the city. There is a 94 second cycle length with a protected/permissive left turn phase for the NE left and SE left movements from Union Blvd onto Royal Pine Dr. The right in/out entrance was not included in the table as all movements are LOS A with minimal delay. The 2045 total traffic conditions are also projected to operate at LOS C or better for all the intersection movements. An annual growth factor of 2% was applied to the background traffic which caused most of the approaches to have a slight increase in average delay per vehicle as shown in the table below. Background traffic LOS is shown in the expanded Table 2b in the Appendix.

A Synchro model was also analyzed for the year 2025 using the site generated traffic from the previous study which had a significantly greater number of trips. Overall, the intersections all operated at a very similar LOS to the current proposed site but with slightly greater delays per vehicles for all the approaches. The associated synchro model reports are in the Appendix.

Emergency vehicular site egress to the arterial roadway system is shown in Figure 8 in the Appendix. The primary egress route is only 600 feet long via Royal Pine Drive to Union Blvd. Two secondary routes exist to Briargate Pkwy and Chapel Hills Drive. The route to Briargate Pkwy is roughly 1 mile long using Pine Manor Drive. The route to Chapel Hills Drive is roughly 1.5 miles long using Royal Pine Drive in northwest direction. Additional site access points from N Union Blvd and/or N Powers Blvd have been suggested but are not feasible. An access from N Union Blvd would not meet minimum spacing requirements from the nearby signalized intersections. An access from N Powers Blvd would require a break in the highway limited access line and there are also issues with existing steep grades and a retaining wall.

Table 2a

*Please see table 2b for background traffic

6.0 Roundabout & Queuing Analysis

The existing roundabout at the intersection of Royal Pine Dr and Purple Plum Way was analyzed for traffic operations and safety. As shown in the previous section, the single lane roundabout provides LOS A for all the approaches. A queuing analysis was created using Synchro Traffic Simulation and the results are shown below in Table 3. The calculated queue lengths are adequately provided for with the existing spacing between intersections.

The roundabout geometry was examined by reviewing previous construction drawings and aerial images. The layout of the approaches and circulating roadway appear to meet all the design standards according to the Colorado Springs Engineering Criteria Manual. The truck apron was designed to contrast from the roadway and central island with patterned concrete.

Table 3 also provides a check of queuing conditions for the Union/Royal Pine signalized intersection. All queues are contained within the existing turn bays.

Table 3

* Single lane approach for all movements

7.0 Bike and Pedestrian Safety

There are existing bike lanes along both sides of Royal Pine Drive starting from N Union Blvd and extending beyond the study area. The approaches for the single lane roundabout on Royal Pine Dr have bike ramps which allow bicyclists the option to transition onto the sidewalk. Purple Plum Way is a low volume/low speed local road where bicyclists can share the roadway with vehicles.

There are sidewalks on both sides of the Royal Pine Drive within the study area. Pedestrians can safely cross Royal Pine Drive using the crosswalks at the roundabout or the signalized intersection of N Union Blvd. The crosswalks at the single lane roundabout all meet the minimum 25' offset requirement from the outer edge of the circulatory lane and have the proper signing and striping. The sidewalk leading into the proposed site has not been constructed but is included in the proposed site layout. The lighting

at the existing roundabout could be improved to provide greater safety for pedestrians as there is currently only one streetlight at the roundabout.

8.0 Existing Residential Street Analysis

This site is adjacent to existing residential streets and this section will focus on traffic impacts and recommended mitigation. City provided traffic data was reviewed and confirms that existing conditions may warrant consideration of traffic calming measures to address vehicular speeding and cut-thru volume. The city has a Neighborhood Traffic Management Program (NTMP) (see website: [Neighborhood Traffic Calming | City of Colorado Springs](#)) and their process should be followed for further study and potential installation of improvements. As presented previously in this report, the portion of site traffic projected to use these residential streets (not going straight towards Union Blvd) is minor but could exacerbate existing concerns with traffic safety. The addition of traffic calming measures to these streets could be used to control speeding and discourage use as a cut-thru route.

Speed counts were conducted at following three (3) locations:

1. Pine Manor Drive west of Sand Flower Drive
2. Pine Manor Drive east of Sycamore Glen Trail
3. Royal Pine Drive south of Pinedale Drive

The speed limit on Pine Manor Drive is posted at 25 mph. The average speeds recorded were 35 mph west of Sand Flower Drive and 36 mph east of Sycamore Glen Trail. The top 15% of speeds all exceeded 41 mph with higher speeds for the westbound vehicles. The excessive speeding relative to the posted speed limit is mainly attributed to the wide roadway width of 36' without any on street parking. The speed limit on Royal Pine Drive is posted at 30 mph. The average speeds recorded were 37 mph with the top 15% of speeds exceeding 40 mph. These results were very similar to those on Pine Manor Drive but with less of a difference from the posted speed limit. There was one speed related accident reported over the last 3 years on this roadway section. The full speed count results are included in the appendix.

There have already been speed bumps installed on Pine Manor Drive west of Sycamore Glen Trail. Speed bumps/humps are no longer used per City Policy so other options should be explored. Radar speed check signs could be installed which are highly effective at reducing average roadway speeds. Another option to reduce speeds could be changing the intersection of Pine Manor Dr and Sycamore Glen Trail from two-way stop control to an all-way stop.

9.0 Conclusions and Recommendations

This report shows that the proposed site traffic from this infill development can be accommodated by the surrounding street network. The overall site will contain significantly fewer trips than approved with the previously approved concept plan. The site utilizes two existing accesses along Royal Pine Drive (collector street). Ultimate access to the arterial

system is from the intersection with Union Blvd, which is already signalized. Union Blvd is currently under capacity for a six-lane arterial and can accommodate the additional site traffic. The single lane roundabout is appropriate for a collector street intersection with the site access and Purple Plum Way (local neighborhood street). The site is adjacent to existing residential streets that will serve a minor percentage of site generated traffic. The installation of traffic calming measures should be considered through the City's NTMP program.

Traffic Engineer's Statement:

This traffic report and supporting information were prepared under my responsible charge and they comport with the standard of care. So far as is consistent with the standard of care, said report was prepared in general conformance with the criteria established by the city for traffic reports.

MEMORANDUM

TO:

DBG Properties, LLC
Attn: Eric Grodahl, Partner
2164 SW Park Place
Portland, OR 97206
(503) 956-4355

FROM: Derek Schuler, P.E., PTOE**DATE:** June 2, 2023**RE:** Trip Generation Update Memo for Royal Pine Apartments
(Union & Powers) Colorado Springs, Colorado

This memorandum serves to update the overall site traffic trip generation for the subject site as it relates to the proposed concept plan amendment. Currently, there are three existing sites within the overall development:

- Urgent Care Center/Medical Office Building – 14,800 sf
- Medical/Dental Office Building – 4,600 sf
- Animal Hospital/Veterinary Clinic – 6,000 sf

In addition to these existing land uses, the following land uses are proposed for the remaining undeveloped property:

- Apartments (Multi-family housing (low rise))
- Leasing Office/Clubhouse (resident use only)

Trip generation for the existing and proposed land uses was determined using the Trip Generation Manual, 11th Edition (2021) published by the Institute of Transportation Engineers. See Table 1 below for the calculation of the revised site trips. Based on full buildout of the overall site with the land uses described above, the development is estimated to generate 2,257 total weekday trips.

The previous Condition of Record on the approved Concept Plan for the overall development established a trip generation budget of 8,441 weekday trips. As noted above, the revised land uses generate significantly fewer trips (2,257 trips) than the maximum allowed (8,441 trips). Per Table 1, the proposed site is anticipated to generate 149 trips (57 in/92 out) in the morning peak hour and 184 trips (101 in/83 out) in the evening peak hour.

¹Source: "Trip Generation" Institute of Transportation Engineers, 11th Edition, 2021; KSF = 1000 SF of gross floor area.

²This code accounts for apartments of various sizes with average of 2.72 residents per dwelling unit (DU). This is considered conservative for this site's mix of one, two, and three bedroom apartments.

³This is an estimated value based on a staff of 2 employees seeing potential residents. Clubhouse is restricted to site residents only.

If you have any questions or would like to discuss my analysis further, please don't hesitate to contact me.

Sincerely,
Drexel, Barrell & Co.

Derek Schuler, P.E., PTOE
Transportation Group Leader
