RE: Printers Hill
Traffic Impact Study
Colorado Springs, CO
LSC #S224481

Dear Mr. Dossey,

LSC Transportation Consultants, Inc. has prepared this traffic impact study (TIS) for Printers Hill. The Printers Hill site is located within the City of Colorado Springs, Colorado. The Printers Hill site is located southeast of the intersection of Union Boulevard and Pikes Peak Avenue.

REPORT CONTENTS

The preparation of this report included the following:

- Inventory of existing adjacent and nearby area street system. This included surface conditions, functional classifications, roadway widths, lane configurations, traffic control, posted speed limits, pavement markings, intersection and access spacing, roadway and intersection alignments, auxiliary left- and right-turn lanes, intersection sight distances, etc.;
- Review of existing conditions and plans for pertinent transportation system information and area improvements in the vicinity;
- Morning and late-afternoon peak-hour turning-movement traffic counts at the following intersections:
 - Union Boulevard/Pikes Peak Avenue
 - Union Boulevard/Parkside Drive
 - Pikes Peak Avenue/Printers Parkway
 - Pikes Peak Avenue/Iowa Avenue
 - Union Boulevard/Platte Avenue
- Estimates of average weekday and peak-hour trip generation for the proposed development;

- Estimation of directional distribution of site-generated vehicle trips on the area street system, and at the study-area intersections;
- Projections of site-generated turning-movement traffic volumes at the study-area intersections;
- Estimates of long-term (20-year) background traffic volumes at the study-area intersections and access points;
- Total traffic (site traffic-plus-existing/future-background traffic) projections at the study-area intersections for the short and long term;
- Level of service (LOS) analysis at the study-area intersections;
- Queuing analysis for the key turning movements at the study-area intersections;
- Evaluation of Traffic Criteria Manual requirements for auxiliary right-/left-turn lanes;
- Other recommended improvements/modifications to the study-area streets and intersections, including street system/intersection and pedestrian/bicycle facility improvements, intersection traffic control; and
- Summary of compiled data, analysis, findings, and recommendations.

LAND USE PLAN

Figure 1 shows the site location relative to the adjacent and nearby streets. The Printers Hill redevelopment site is located southeast of the intersection of Union Boulevard and Pikes Peak Avenue (El Paso County parcel IDs 6416300042 and 6416300041). Figure 2 shows the Land Use Plan. The plan shows a mix of residential, commercial, retail, office and civic land uses. Table 1 shows land use details from the Land Use Plan, by parcel, used to estimate trip generation and resulting traffic impacts.

Project Vision for Mobility & Transportation

The applicant's project vision is to create a high-density, urban community that prioritizes pedestrian/bicycle/non-motorized and public-transit travel modes both within the development site as well as to/from surrounding neighborhoods, businesses, and Memorial Park. Ultimately, if Central Business District (CBD)/downtown-type mobility and associated design concepts for multi-modal street corridors are implemented within this project and in the adjacent areas, street corridors between this development and downtown are more likely to see a shift and be transformed as well.

Objectives include avoiding additional street width for motor vehicles, minimizing pedestrian crossing distances, lowering travel speeds on the surrounding streets, adding pedestrian crossing infrastructure at all major access points to Union Boulevard and Pikes Peak Avenue, and designing/accommodating the Pikes Peak Avenue corridor adjacent to the project to accommodate the city-master-planned bike corridor.

Access and Circulation

Summary

Figure 2 also shows the proposed streets within the plan area and proposed internal street connections (access points) to adjacent Pikes Peak Avenue and Union Boulevard. An additional vehicular access to Pikes Peak Avenue aligning with Bonfoy Street is also proposed. The existing property access drive aligning with Iowa Avenue at Pikes Peak Avenue will remain (but will be reconfigured). The current vehicular access to the property on Union Boulevard is proposed to be relocated to the south. Please refer to Figure 2 and the attachments in Appendix A, which depict these access locations and the internal circulation system. Internal street connectivity, internal access points/intersections, and parking areas are shown on these plans.

Vehicular Access Points - Details

Pikes Peak Avenue

- The access aligning with Bonfoy on the north side of Pikes Peak Avenue is proposed as a new full-movement, unsignalized (two-way, stop-sign-controlled (TWSC)) intersection.
- The existing property access aligning with Iowa Avenue is proposed as a full-movement, likely signalized access point (provided warrant(s) for signalization are met and/or the City allows/requires a signal to be installed at this location).

Union Boulevard

- A new full-movement, likely signalized access (once warrants are met) is proposed for a location about 140 feet north of the intersection of Union Boulevard and Memorial Drive (centerline spacing). This location would be about 870 feet south of Pikes Peak Avenue (centerline spacing). The existing property access driveway to Union would be closed to vehicular traffic and utilized as an on-site, pedestrian corridor.
- Please see Figure 9 (attached) for a summary of LSC's sight distance field measurements for the proposed west site-access location on Union.

Printers Parkway/International Circle

- This property does not have frontage along Printers Parkway and no vehicular access connection to Printers Parkway or International Circle exist.

Intersection Sight Distance

City of Colorado Springs Requirements

Vehicular access points (proposed arterial street connections/intersections) must meet City of Colorado Springs *Traffic Criteria Manual* standards for sight distance speed line-of-sight along Pikes Peak Avenue and Union Boulevard.

The required City of Colorado Springs' Traffic Criteria Manual intersection sight distance at the access points is 350 feet, as Union Boulevard and Pikes Peak Avenue both have posted speed limits of 35 mph (per Table 1 of the City of Colorado Springs' *Traffic Criteria Manual*). Sight distance lines-of-sight will need to be met with the detailed site development plans and maintained in the future by the property owner(s).

Sight Distance Evaluation

Union Boulevard/West Property Access Point

Sight distance would be met to the north and south from the west access point, as exiting drivers would have 477 feet of sight distance looking towards vehicles arriving from at the Union/Pikes Peak Avenue intersection. Sight distance looking to/from the south is unobstructed to the signal at Union/Parkside.

Pikes Peak Avenue/Northeast Access Point (across from Iowa Avenue)

Sight distance would be met to the east and west from the north access point, as exiting drivers have an unobstructed line of site to the west to about Bonfoy Street and beyond the intersection of Pikes Peak Avenue/ Printers Parkway to the east. Both are located over 600 feet from the north site access.

Pikes Peak Avenue/Northwest Access Point (across from Bonfoy Avenue)

Lines of sight on Pikes Peak Avenue are unobstructed looking to/from the signal at Union Boulevard (to the west) and looking to/from the signal at Printers Parkway (to the east).

Internal Street Details

Plans for the streets internal to the site are attached in Appendix A.

STREET AND TRAFFIC CONDITIONS

Existing Streets

Figure 1 shows the streets adjacent to and in the vicinity of the site. Adjacent streets and other streets in the study area are identified below followed by a brief description of each:

Pikes Peak Avenue extends east through central Colorado Springs from South Cascade Avenue to Wooten Road. The City of Colorado Springs' *Major Thoroughfare Plan* (MTP) shows Pikes Peak Avenue as a Principal Arterial. However, it has been determined that Pikes Peak Avenue will not extend east across Sand Creek. Adjacent to the site, Pikes Peak Avenue has five lanes with a center two-way left-turn lane (TWLTL) and a posted speed limit of 35 miles per hour (mph). The eastbound approach at its intersections with Union Boulevard and Printers Parkway has both auxiliary left-turn and right-turn lanes, while the westbound approach at these intersections only has auxiliary left-turn lanes. Traffic signals along Pikes Peak Boulevard near the site are coordinated with a 138-second cycle length.

Union Boulevard is a five-lane Principal Arterial that runs north/south through Colorado Springs between Circle Drive and Old Ranch Road. Adjacent to the site, the 5-lane roadway has a center TWLTL painted median, and the posted speed limit is 35 mph. Auxiliary left-turn lanes exist on the northbound and southbound approaches at its signalized intersection with Pikes Peak Avenue, while the northbound approach has a short exclusive right-turn bay. Traffic signals along Union Boulevard near the site are coordinated with a 138-second signal length.

Parkside Drive is a three-lane roadway with Industrial/Commercial classification that extends between Union Boulevard and Bijou Street. The roadway has a striped, two-way left-turn lane between Union Boulevard and Pikes Peak Avenue. Additionally, there is a striped bicycle lane and parking lane in each direction between Union Boulevard and Printers Parkway. Its intersection with Union Boulevard is signalized with turn lanes for most turning movements, although there is no turn lane for the northbound right-turn movement.

Printers Parkway is a four-lane non-arterial street extending generally north-to-south for 0.5 miles between Pikes Peak Avenue and Airport Road. The posted speed limit on Printers Parkway is 35 mph. The eastbound right-turn auxiliary turn lane is currently a free, channelized-right for vehicles turning from Pikes Peak Avenue.

Existing Traffic Volumes

Vehicular peak-hour, turning-movement counts were conducted at the study-area intersections. The study area includes the following intersections: Union Boulevard/Pikes Peak Avenue, Union Boulevard/Platte Avenue, Pikes Peak Avenue/Printers Parkway, Pikes Peak Avenue/Iowa Avenue, Pikes Peak Avenue/Bonfoy Street, and Union Boulevard/Memorial Drive.

Existing morning and evening weekday peak-hour traffic volumes at these study-area intersections based on counts and estimates by LSC and data provided by City Traffic Engineering are shown in Figure 3. Raw count data reports are attached.

Union Boulevard currently carries about 16,000 to 17,000 vehicles per day adjacent to the site, and Pikes Peak Avenue currently carries about 12,000 to 13,000 vehicles per day adjacent to the site. Pikes Peak Avenue west of Union carries about 15,000 to 16,000 vehicles per day. These are based on factored peak-hour-volume data. These volumes are under capacity for five-lane arterial streets.

Existing Levels of Service

The study-area intersections have been analyzed to determine the current intersection levels of service, based on the existing traffic volumes for the morning and evening peak-hour time periods. Existing signal timings have been used for the analysis.

Level of service (LOS) is a quantitative measure of the level of congestion or delay at an intersection and is indicated on a scale from "A" to "F." LOS A is indicative of little congestion or delay. LOS F indicates a high level of congestion or delay. Table 2 shows the level of service delay ranges for signalized and unsignalized intersections.

Intersection LOS of "D" or better meets City standards. Individual turning-movement levels of service can operate at "E" or "F," depending on the site-specific situation. These are often evaluated more thoroughly to identify if the rating represents a near-capacity or over-capacity condition (and/or if there are vehicle queuing issues) or if the particular turning movement or approach LOS operates acceptably, but with an average delay in the "E" or "F" range of delay values.

Table 2: Intersection Levels of Service Delay Ranges

Level of Service	Signalized Intersections	Unsignalized Intersections
	Average Control Delay (Seconds Per Vehicle)	Average Control Delay (Seconds Per Vehicle) ¹
A	10.0 sec or less	10.0 sec or less
B	10.1-20.0 sec	10.1-15.0 sec
C	20.1-35.0 sec	15.1-25.0 sec
D	35.1-55.0 sec	25.1-35.0 sec
E	55.1-80.0 sec	35.1-50.0 sec
F	80.1 sec or more	50.1 sec or more

¹ For unsignalized intersections, if V/C ratio is greater than 1.0 the level of service is LOS F, regardless of the projected average control delay per vehicle.

Detailed Synchro reports are attached. A summary of LOS results for the weekday morning and evening peak hours is presented in the attached Table 3 (attached).

Left-Turn Lanes & Queuing Observations

Union Boulevard and Pikes Peak Avenue are both five-lane Principal Arterials with a center, two-way, left-turn-lane (TWLTL) painted median.

Union Boulevard/Pikes Peak Avenue Intersection

While Union Boulevard and Pikes Peak Avenue generally have a center, two-way, left-turn-lane (TWLTL) painted median, there is striping for dedicated left-turn lanes on all approaches at the signalized intersection of the two streets. Most existing queues were observed to be accommodated by existing left-turn lane lengths on Union Boulevard at each intersection. SimTraffic simulation observations indicated that minimal left-turn queues on each approach would clear after each cycle.

The northbound-left queue on Union Boulevard approaching Pikes Peak Avenue was observed to be approximately 321 feet, which was reflected in the SimTraffic 95th-percentile queue estimates (attached). Long-term SimTraffic simulations project that vehicles would be prevented from entering the northbound-left turn lane at Union/Pikes Peak during three percent of the PM peak hour.

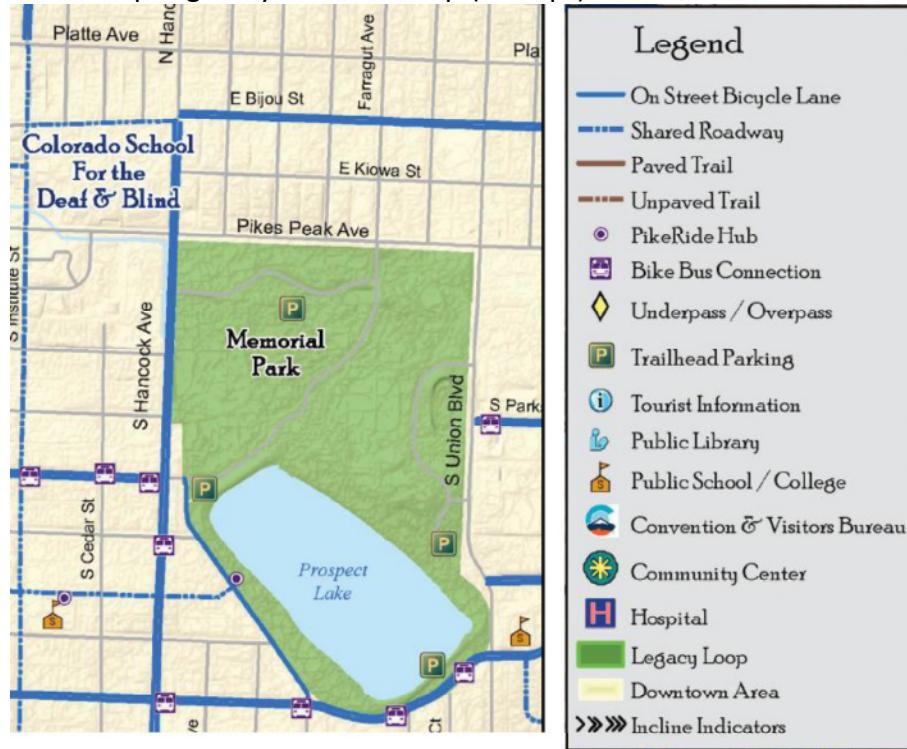

Notes of Observations During a Site Visit

LSC conducted a site visit midweek from 5:00-5:30pm to observe existing queuing on the northbound approach of Union Boulevard between Pikes Peak Avenue and Parkside Drive. Approximately 6-8 vehicles were observed in the northbound-left turn lane during each cycle, with about 5-6 making it through on the protected-left phase and another 2-3 having to wait for the permissive-left phase. Approximately 8-12 vehicles arrived in both northbound-through lane, and they typically arrived in platoons each cycle before waiting for a green phase at Pikes Peak. The northbound-through queue extended back to exactly the 35-mph sign on the light pole during each cycle in both lanes (approximately 310 feet south of the stop bar at Pikes Peak Avenue).

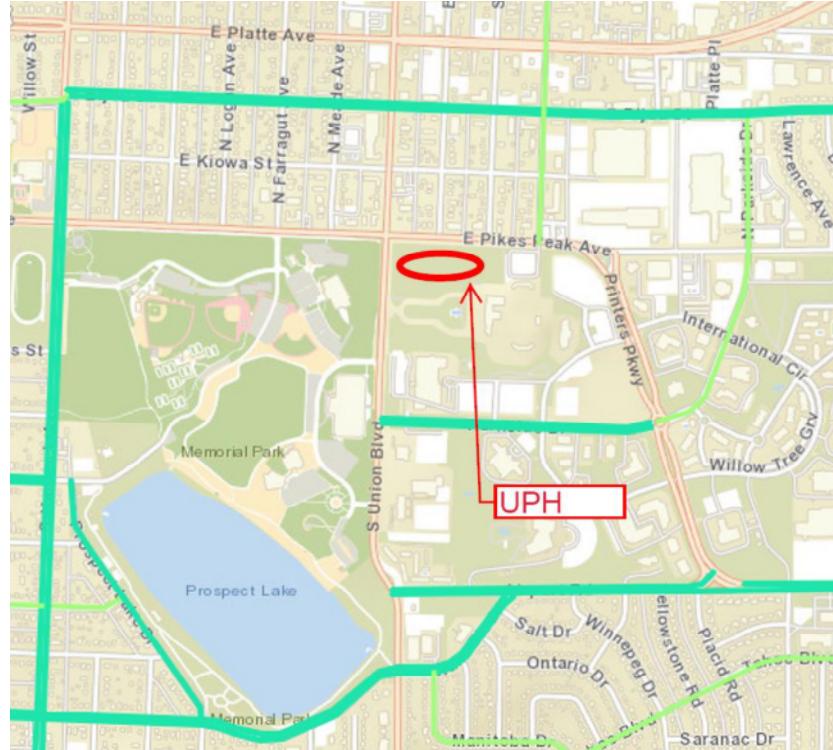

Pedestrian and Bicycle Facilities

Sidewalks exist along the east side of Union Boulevard adjacent to the site. There are no existing sidewalks on the west side of Union Boulevard north of the Memorial Park entrance. Bike lanes are striped on Parkside Drive in the vicinity of the site. Please refer to the graphic below from the *Downtown Colorado Springs Bicycle Route Map* below for more details, and the second graphic showing the existing on-street bike lanes and shared roadways surrounding the UPH property.

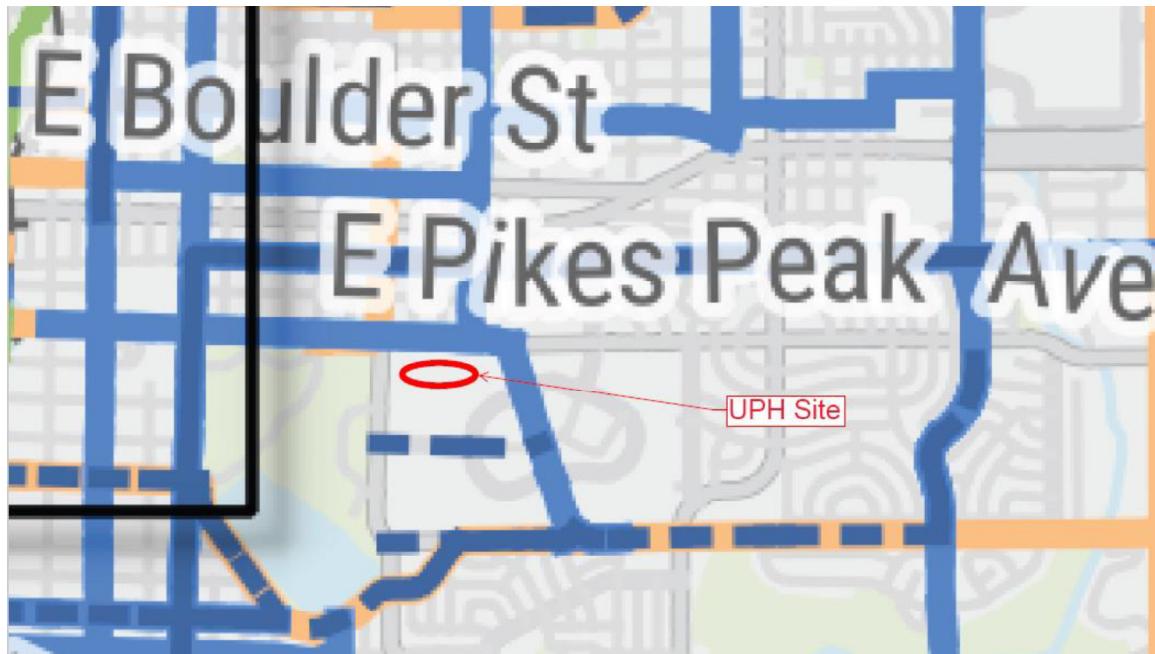

Downtown Colorado Springs Bicycle Route Map (Excerpt):

Existing Bicycle Facilities:

Note: The clip below shows the portion of the City's bike vision plan within the area surrounding the UPH property.

City of Colorado Springs Bike Plan DRAFT

Vision Network

Colorado Springs Bike Master Plan

- Bike Master Plan Corridor
- Previously Planned Corridors*
- - - Existing On-Street Bike Facility
- Existing Trails
- /// Airports
- Military Boundary
- Parks

*Includes previously planned corridors from the PPACG Regional Nonmotorized Transportation System Plan, Experience Downtown Master Plan, and Parks, Recreation, Trails and Open Space Master Plan.

Bike Share

The Pike Ride bike-share program's operating area is west of Union Boulevard, with hubs located within Memorial Park.

Public Transit

Mountain Metro Bus Route 7 runs on Union Boulevard and Parkside Drive in the vicinity of the site. There are bus stops on Parkside Drive just east of Union Boulevard. These public transit exhibits are shown in *Mountain Metropolitan Transit 2045 Regional Transportation Plan– Transit* by HDR (2020).

Truck Routes

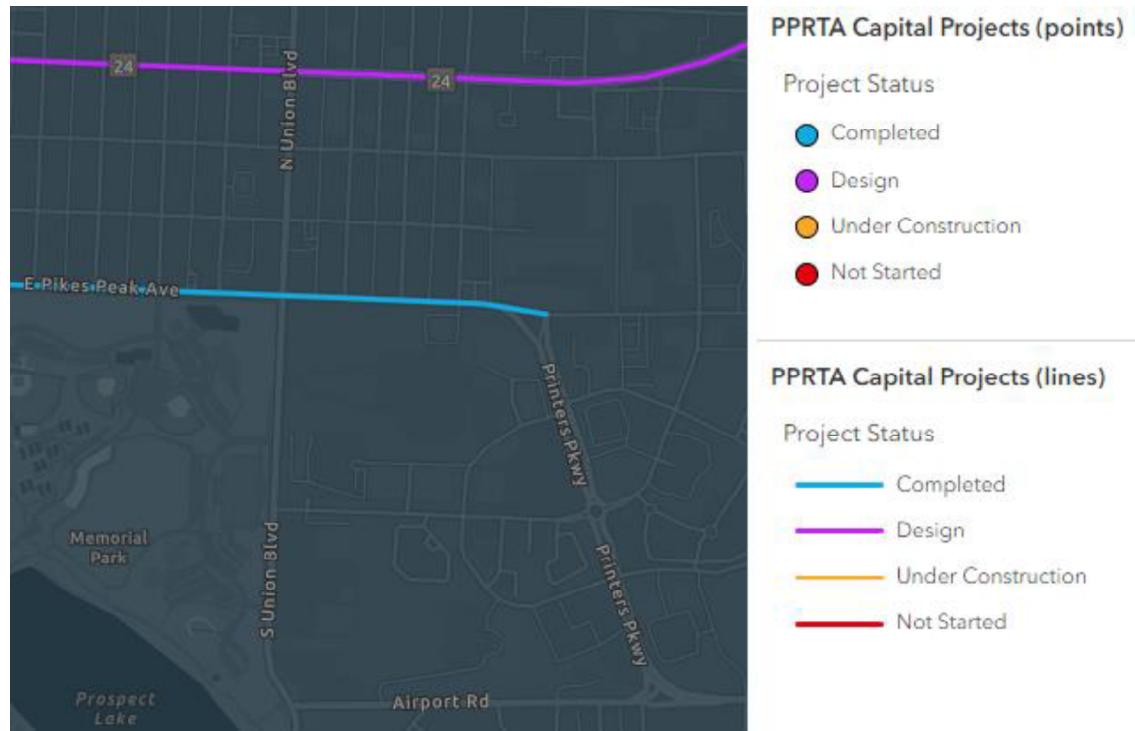

Designated truck routes exist along Union Boulevard, as shown below on the City of Colorado Springs' *Truck Route Map* from December 2019:

ROADWAY IMPROVEMENT PUBLIC PROJECTS

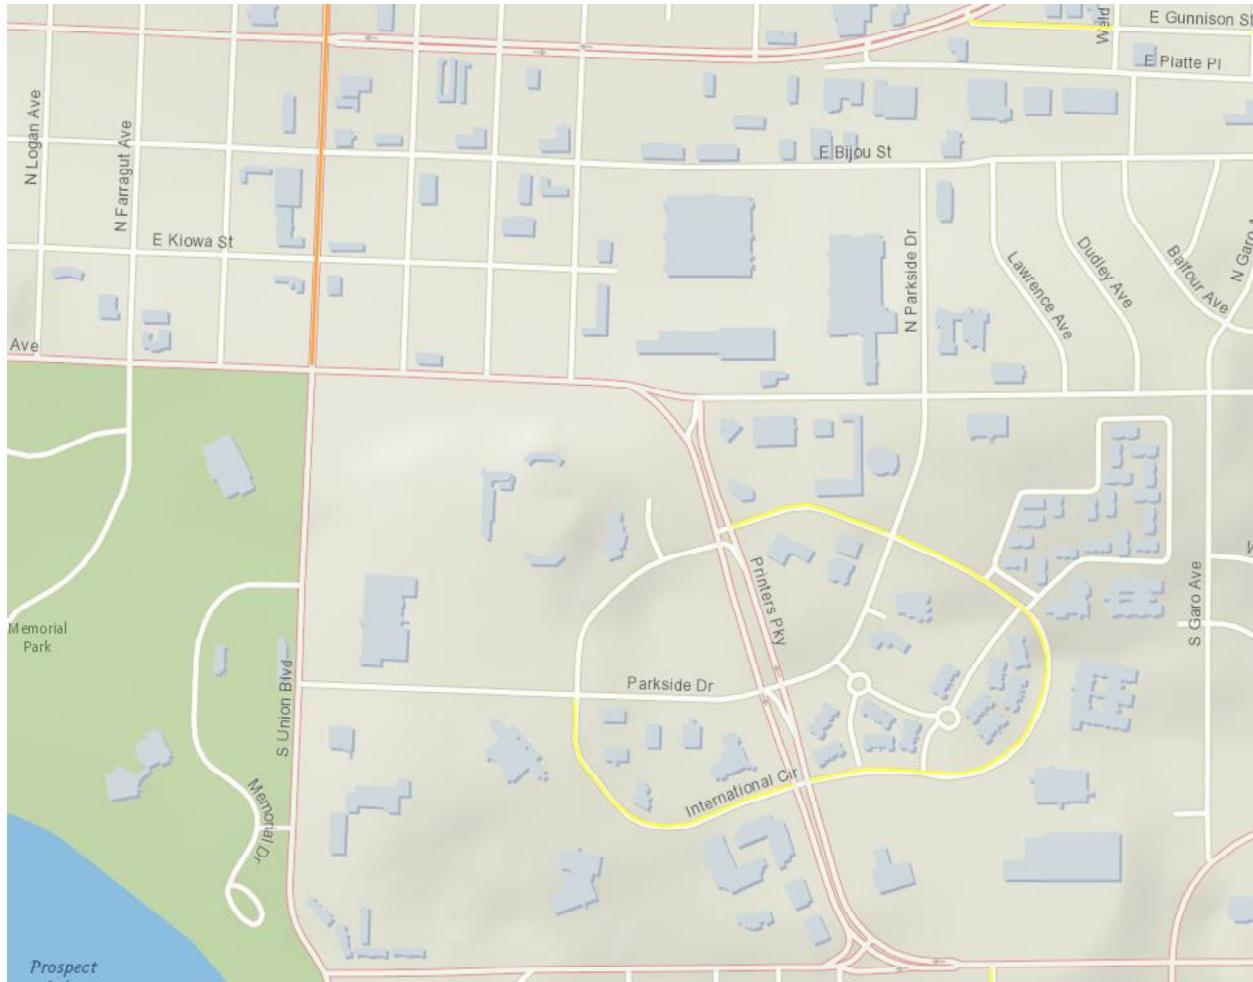

Pikes Peak Rural Transportation Authority

No upcoming capital improvement projects in the study area are planned by the Pikes Peak Rural Transportation Authority (PPRTA). Nearby roadway improvements to Pikes Peak Avenue were completed in 2021, as indicated below.

Roadway Paving Projects

As shown on the City's 2C project map, Union Boulevard is projected to be repaved north of Pikes Peak Avenue in 2023, while most of International Circle is scheduled to be repaved in 2025.

TRIP GENERATION

Estimates of the vehicle trips projected to be generated by the proposed development have been made using the nationally-published trip-generation rates from *Trip Generation, 11th Edition, 2021* by the Institute of Transportation Engineers (ITE). Table 1 (attached) presents the estimated trip generation by parcel.

Internal Trips

Internal trips are trips that occur within the site and do not impact the external roadways. Because the site is planned to have multiple mixed retail, restaurant, office, and residential land uses, some of the generated trips will remain within the site. Table 1 includes estimates of

internal trip capture to account for trips generated estimated to be “captured”/remain within the site. The internal trips were estimated using the NCHRP 684 Internal Trip Capture Estimation Tool, but adjustments have been applied by LSC.

Total External Trip Generation

Approximately 16,225 total external daily trips are projected to enter and exit the site at the access points on the average weekday. During the morning peak hour, approximately 680 vehicles would enter and 566 vehicles would exit the site. During the evening peak, approximately 643 vehicles would enter and 778 vehicles would exit.

Pass-by Trips

The trips generated by the retail and food/beverage land uses have also been aggregated by trip type to account for the pass-by phenomenon. A pass-by trip is one made by a motorist who would already be on an adjacent road regardless of the proposed development, but who stops in at the site while passing by. The pass-by motorist would then continue on his or her way to a final destination in the original direction.

Diverted trips have also been estimated. Diverted trips result in altered turning movements at the nearby intersection of Pikes Peak/Union.

TRIP DISTRIBUTION

An estimate of the directional distribution of site-generated vehicle trips to the study-area streets and intersections is a necessary component in determining the site-generated traffic volumes. The attached Figure 4 shows the directional-distribution estimate for the primary site-generated trips. The figure shows the percentages of the site-generated vehicle trips (primary trips) projected to be oriented to and from the site’s major approaches. Estimates have been based on the following factors: traffic counts conducted at major intersections adjacent to the proposed development, the proposed land uses, the access plan, the area road system serving the site, the site’s geographic location, and previously-conducted LSC studies in the vicinity.

Site-Generated Traffic

Site-generated traffic volumes for the development during the weekday morning and evening peak hours are shown in Figure 5.

Site-generated traffic volumes have been calculated by applying the directional-distribution percentages estimated by LSC (from Figure 4) to the trip-generation estimates (from Table 1). The pass-by trips and diverted trips were assigned, based on the magnitude and direction of the peak-hour traffic volumes projected for the major study-area streets/roads.

BACKGROUND TRAFFIC VOLUMES

Background traffic is traffic on the adjacent streets that is forecast to be present without the proposed redevelopment land uses and resulting trip generation/site-generated traffic.

Future (2043) Baseline/Background Traffic Volumes

Estimates of long range, 2043 baseline/background traffic volumes have also been analyzed. Estimated 2043 background traffic volumes on adjacent roadways and at the study-area intersections are based in-part on model output from the 2043 Pikes Peak Regional Traffic Model and MS2Soft count data. Background volumes are based on general growth rates. Background traffic estimates exclude projections of site-generated traffic/additional trips to be generated by the addition of proposed land uses shown on the Land Use Plan.

Future background traffic projections (shown in Figure 7) reflect slight increases in through volumes on adjacent study-area roadways. The following are the annual growth rates applied to existing volumes:

- Street segments described in terms of the legs of the Union Boulevard/Pikes Peak Avenue intersection:
 - North leg (Union Boulevard north of Pikes Peak Avenue) – 0.25 percent per year
 - East leg (Pikes Peak Avenue east of Union Boulevard) – 0.50 percent per year
 - South leg (Union Boulevard south of Pikes Peak Avenue) – 0.50 percent per year
 - West leg (Pikes Peak Avenue west of Union Boulevard) – 1.25 percent per year

TOTAL TRAFFIC VOLUMES

Site-generated traffic volumes were added to existing traffic volumes for the resultant short-term total traffic, or “existing-plus-site” volumes shown in Figure 6.

Similarly, 2043 total traffic volumes, shown in Figure 8, were calculated by adding the site-generated traffic with the 2043 background traffic volumes.

INTERSECTION LEVEL OF SERVICE ANALYSIS

The study area intersections have been analyzed to determine the projected short and long-term future intersection levels of service based on, existing-plus-site-generated, future long-term background traffic, and total future traffic volumes for the morning and evening peak-hour time periods.

Detailed Synchro reports are attached. A summary of LOS results for the weekday morning and evening peak hours is presented in Table 3 (attached).

AUXILIARY TURN-LANES

Table 2 of the City of Colorado Springs' *Traffic Criteria Manual* contains turning-volume thresholds which require auxiliary left- or right-turn lanes by roadway classifications. Roadway classifications for key thoroughfares in the vicinity of the site are based on the City of Colorado Springs' Major Thoroughfare Plan within the newly adopted **PlanCOS**.

- Union Boulevard – Principal Arterial
- Pikes Peak Avenue – Principal Arterial

Left-Turn Lanes

Projected long-term queues for the left-turn movements at the intersections of Pikes Peak/Union, Pikes Peak/Iowa and the other site-access-point intersections can be accommodated within the center painted medians.

Right-Turn Deceleration Lanes

Union Boulevard

Per the City of Colorado Springs' *Traffic Criteria Manual*, Principal Arterial roadways are required to have a right-turn lane if the right-turning movement exceeds 25 vehicles per hour (vph).

Currently, an 80-foot northbound-right turn bay exists at the intersection of Union Boulevard/Pikes Peak Avenue. City traffic engineering has indicated that they would not require lengthening of this lane in order to preserve the existing large trees along the Union Boulevard site frontage.

The northbound projected right-turning volume at the proposed relocated site access on Union Boulevard exceeds the threshold requiring a right-turn deceleration lane. However, there does not appear to be sufficient right-of-way along the east side of Union Boulevard for adding a right-turn lane.

Pikes Peak Avenue

Although the projected eastbound right-turning volumes at the proposed site-access points on Pikes Peak Avenue would be above the *Traffic Criteria Manual* threshold for right-turn lanes, the applicant is requesting that this code requirement be waived based on the "Project Vision for Mobility & Transportation" section above, such that the existing south curb line of Pikes Peak Avenue remains unchanged.

Street widening associated with the addition of right-turn deceleration lanes at the access points would be contrary to the applicant's vision for area mobility and prioritization/accommodation of travel modes other than private motor vehicles. Additionally, it would require right-of-way

dedication from private property. Finally, added right-turn lanes would have potential negative implications for pedestrians, cyclists, and other non-motorized travel in the area of the project. Therefore, the applicant is proposing maintaining the existing street curb lines along the site frontage of Union Boulevard and Pikes Peak Avenue but not adding right-turn deceleration lanes.

VEHICLE QUEUING ANALYSIS

Queuing analysis was performed for key turning movements at the study-area intersections during the long-term peak hours. The queuing analysis results are presented in Table 4 (attached).

SimTraffic Simulation Analysis – General Technical Information

“Upstream block time” represents the percentage of time during the peak hour in which the entry point for a turn lane upstream of the subject intersection is blocked by a queue in the adjacent through lane. “Storage block time” is the proportion of time in which the turn lane’s queue exceeds the available storage length and left-turning vehicles overspill the turn lane in the model and into the adjacent through lane.

“Maximum queue” represents the maximum queue length observed for each individual lane during the 15-minute analysis period. SimTraffic records the maximum back of queue observed for every two-minute period. In SimTraffic, a vehicle is considered queued whenever it is behind another vehicle traveling at less than 10 feet/second (approximately 7 mph) or at a stop bar. The maximum observed queue may not occur during the same interval in which the highest upstream block time (percent) or storage block time (percent) occurs. LSC has reported the highest value for each metric for each turn lane/approach regardless of whether or not they occur in the same 15-minute interval.

The reported queue length for auxiliary turn lanes in SimTraffic is generally limited by the turn-lane length. SimTraffic simply reports the maximum observed queue length during simulations. Any spillover from a left- or right-turn lane is reported in the adjacent lane queue length.

Please refer to the laneage schematics presented in Figures 6 and 8.

Union Boulevard/Pikes Peak Avenue

The 95th-percentile queue length for the northbound-left turn lane is projected to reach 382 feet, which would exceed the available storage during 0 percent of the long-term PM peak hour. There is no direct east-west connection to the downtown Colorado Springs area due to Memorial Park. It is likely that drivers would choose an alternative route to head west, when/if an infrequent longer queue occurs, such as heading north to turn northbound-left at Union/Platte instead.

To the south, the proposed west site access to Union Boulevard would be located approximately 140 feet north of Memorial Drive. Projected 95th-percentile queues for the southbound-left at

the west site access are projected to reach 87 feet, which would not exceed capacity during either of the long-term peak hours.

Pikes Peak Avenue – Union Boulevard to Bonfoy Avenue

There is currently a closely-spaced TWLTL on Pikes Peak Avenue between Union Boulevard and Bonfoy Avenue. Based on projected queues, LSC recommends that the solid white striping for the westbound-left turn lane be modified from 140 feet total (80-foot lane plus 60-foot taper) to be 200 feet total (150-foot lane plus 50-foot taper). The TWLTL striping at Bonfoy Avenue would be shortened to 100 feet total (50-foot lane plus 50-foot taper). This configuration would accommodate queues on Pikes Peak Avenue for both of these back-to-back left-turning movements.

LSC recommends a two-lane approach northbound, including a separate northbound-right turn bay. The other lane would be a shared northbound-through/left. Two lane lengths were modeled for the northbound right-turn lane – a 200-foot-long lane and a 250-foot-long lane. For the 200-foot-long lane, during the long-term PM peak hour, the projected maximum queue for the northbound right-turn lane is about 291 feet, while the outbound travel lane (northbound through/left lane at the intersection) has a projected maximum queue of 472 feet and 95th-percentile queue of 455 feet. For the 250-foot-long lane, during the long-term PM peak hour, the projected maximum queue for the northbound right-turn lane is about 320 feet, while the outbound travel lane (northbound through/left lane at the intersection) has a projected maximum queue of 320 feet and 95th-percentile queue of 293 feet. LSC recommends a northbound right-turn lane within this 200 to 250 range for the storage length, plus a short, reverse-curve-bay taper is recommended.

No modifications would be required to the existing TWLTL striping on Pikes Peak Avenue between Bonfoy Avenue and Iowa Avenue, as the existing westbound-left turn lane approaching Bonfoy would accommodate the maximum long-term projected queue of 66 feet.

Queues on the southbound approach on Bonfoy Avenue would be minimal, so this could remain a single-lane approach.

Pikes Peak Avenue/Iowa Avenue

LSC recommends the southbound approach be configured with two approach lanes, if possible, including a separate left-turn lane to align with the recommended northbound left turn on the south side. Queues for a southbound shared-through/right lane are projected to reach 213 feet.

No modifications would be required to the existing TWLTL striping on Pikes Peak Avenue between Bonfoy Avenue and Iowa Avenue, as the existing eastbound-left turn lane approaching Iowa Avenue would accommodate the maximum long-term projected queue of 56 feet.

Back-to-back left turns on Pikes Peak Avenue between Iowa Avenue and Printers Parkway would accommodate the 95th-percentile queues at Iowa Avenue (85 feet for westbound-left) and at Printers Parkway (31 feet for eastbound-left). No modifications would be required to existing TWLTL striping in this section.

LSC recommends two northbound approach lanes: a northbound-left-only and a shared northbound-through/right. During the long-term PM peak hour, the projected 95th-percentile queue for the northbound through/right lane is 171 feet, while the northbound right-left lane has a projected 95th-percentile queue of 160 feet. LSC recommends a 150-foot northbound left-turn bay plus a short bay taper.

Union Boulevard – Proposed West Site Access to Union Boulevard

The proposed west site access to Union Boulevard would be located approximately 140 feet north of Memorial Drive. The projected 95th-percentile queues for the southbound-left at the west site access are projected to reach 95 feet, which would **not** exceed capacity during either of the long-term peak hours. This queue length would allow for the back-to-back left with the northbound left turn at Union/Pikes Peak Avenue.

The plan shows separate left- and right-turn lanes on the westbound approach. The westbound left lane would have a 95th-percentile queue of 195 feet, while the westbound-right lane would have a 95th-percentile queue of 68 feet. LSC recommends the intersection approach be configured for a 100-150-foot eastbound-right turn lane plus a short bay taper.

INTERSECTION LANEAGE, CONFIGURATION AND TRAFFIC CONTROL

Figure 8 shows the intersection laneage proposed for the access points and adjacent intersections based on Land Use plan trip generation, estimated resulting site-generated traffic, the level of service analysis results, the queuing analysis results, and the “Auxiliary Turn Lane” section above.

PEDESTRIAN AND BICYCLE FACILITIES

Pedestrian Crossing of Union Boulevard

The plan shows a potential grade-separated pedestrian crossing at the location of the existing property access. Also, a signal at the west access is envisioned, which would provide pedestrian crossing capability. The center median immediately south of the access could potentially be used for pedestrian refuge, but that would likely require a raised island rather than restriping.

Pedestrian Crossing of Pikes Peak Avenue

The applicant has indicated that a pedestrian crossing of Pikes Peak Avenue at the Swope Street intersection is a priority to fulfill the project vision. A designated pedestrian crossing of Pikes Peak

likely will require a regular signal or ped signal (like a HAWK signal, which is typically actuated with push buttons). The City Traffic Engineering indicated that the Bonfoy intersection is too close to the Pikes Peak/Union intersection to signalize it (420 feet - centerline spacing - from Pikes Peak/Union). City Traffic has commented that such a signalized, mid-block pedestrian crossing at Swope Street could be considered in future phases, as needed. The crossing would be about a 350-foot walk from the Bonfoy intersection (and about a 400-foot walk from the Iowa/Pikes Peak intersection, which is proposed to be signalized). Potentially, internal walkways could connect directly to this crossing point location.

Pikes Peak Avenue – Bicycle Corridor on the City’s Bike Vision Network

The plan provides for a shared use path along the south side of Pikes Peak Avenue.

Please refer to the attached Appendix A, which explains the City’s identified process for implementing the Bike Vision Network segment of Pikes Peak Avenue east of Union along the site frontage. The general approach is to utilize the Bicycle Facility Toolbox.

SUMMARY & CONCLUSIONS

- The site is projected to generate about 16,226 external driveway vehicle trips on the average weekday.
- During the morning peak hour, approximately 680 vehicles would enter, and 566 vehicles would exit the site.
- During the evening peak, approximately 643 vehicles would enter, and 778 vehicles would exit.
- Please refer to the “Level of Service” section above for detailed LOS analysis results for individual turning movements and approaches at all studied intersections.
- Please refer to the “Auxiliary Turn Lane Analysis,” “Queuing Analysis,” and “Intersection Laneage, Configuration and Traffic Control” sections for details on these elements.
- The “Bicycle and Pedestrian Facilities” section presents plan elements and recommendations.
- City Traffic Engineering has indicated that the developer is required to remit the amount of \$500,000 for the future anticipated traffic signal at the proposed West Site Access/Union Boulevard intersection and Pikes Peak Avenue/Iowa Avenue Intersection.

Intersection Summary

Area Type: Other

Lanes, Volumes, Timings
15: Union Blvd & Platte Ave

Existing
PM

Cycle Length: 114

Actuated Cycle Length: 114

Offset: 100 (88%), Referenced to phase 2:EBTL and 6:WBTL, Start of Green

Natural Cycle: 90

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.94

Intersection Signal Delay: 34.2

Intersection LOS: C

Intersection Capacity Utilization 79.1%

ICU Level of Service D

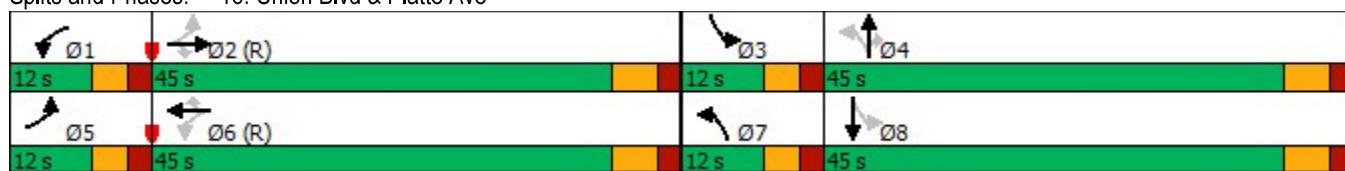

Analysis Period (min) 15

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 15: Union Blvd & Platte Ave

Intersection Summary

Area Type: Other

Cycle Length: 114

Actuated Cycle Length: 114

Offset: 12 (11%), Referenced to phase 2:EBTL and 6:WBTL, Start of Green

Natural Cycle: 90

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.82

Intersection Signal Delay: 34.5

Intersection LOS: C

Intersection Capacity Utilization 79.8%

ICU Level of Service D

Analysis Period (min) 15

95th percentile volume exceeds capacity, queue may be longer.

Lanes, Volumes, Timings

Intersection Summary

Area Type: Other

Cycle Length: 138

Actuated Cycle Length: 138

Offset: 0 (0%), Referenced to phase 2:EBTL and 6:WBTL, Start of Yellow, Master Intersection

Natural Cycle: 85

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.91

Intersection Signal Delay: 40.1

Intersection LOS: D

Intersection Capacity Utilization 87.5%

ICU Level of Service E

Analysis Period (min) 15

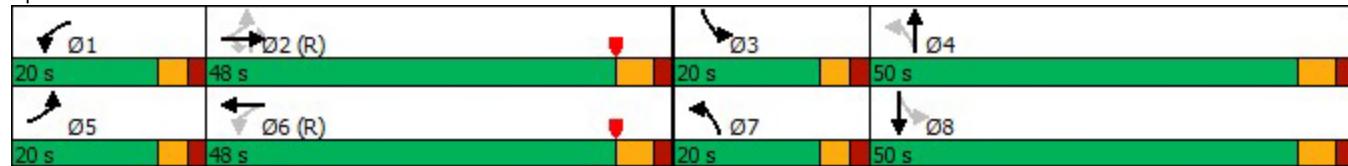

95th percentile volume exceeds capacity, queue may be longer.

Intersection Summary

Area Type: Other

Cycle Length: 114

Actuated Cycle Length: 114

Offset: 0 (0%), Referenced to phase 2:NBTL and 6:SBTL, Start of Green

Natural Cycle: 90

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.97

Intersection Signal Delay: 38.6

Intersection LOS: D

Intersection Capacity Utilization 82.4%

ICU Level of Service E

Analysis Period (min) 15

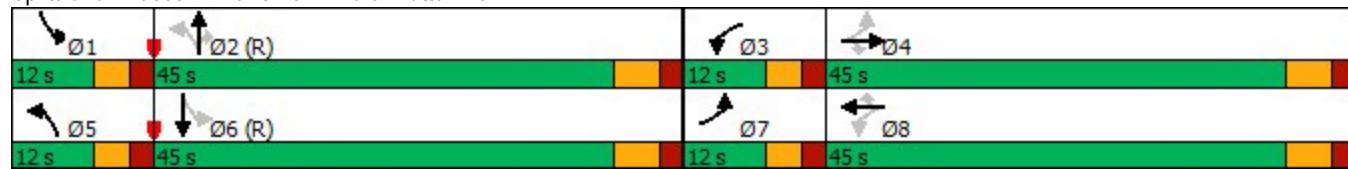

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Intersection Summary

Area Type: Other

Lanes, Volumes, Timings 1: Union Blvd & Pikes Peak Ave

2043 Background

AM

Cycle Length: 114

Actuated Cycle Length: 114

Offset: 0 (0%), Referenced to phase 2:EBTL and 6:WBTL, Start of Yellow

Natural Cycle: 90

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.83

Intersection Signal Delay: 31.2

Intersection LOS: C

Intersection Capacity Utilization 74.4%

ICU Level of Service D

Analysis Period (min) 15

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 1: Union Blvd & Pikes Peak Ave

Lanes, Volumes, Timings
4: Printers Pkwy & Pikes Peak Ave

Intersection Summary

Area Type: Other

Lanes, Volumes, Timings 1: Union Blvd & Pikes Peak Ave

2043 Background

PM

Cycle Length: 114

Actuated Cycle Length: 114

Offset: 0 (0%), Referenced to phase 2:EBTL and 6:WBTL, Start of Yellow

Natural Cycle: 90

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 1.26

Intersection Signal Delay: 40.6

Intersection LOS: D

Intersection Capacity Utilization 86.2%

ICU Level of Service E

Analysis Period (min) 15

~ Volume exceeds capacity, queue is theoretically infinite.

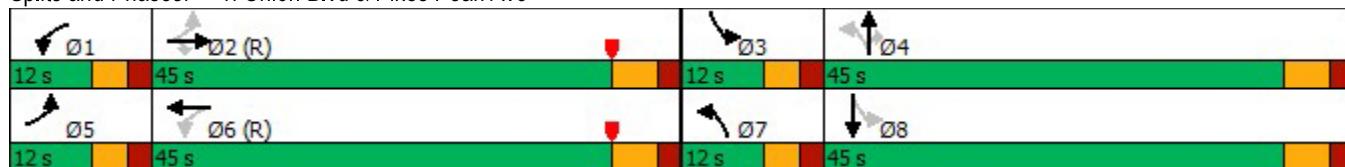

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 1: Union Blvd & Pikes Peak Ave

Lanes, Volumes, Timings
4: Printers Pkwy & Pikes Peak Ave

Actuated Cycle Length: 114

Offset: 12 (11%), Referenced to phase 2:EBTL and 6:WBTL, Start of Green

Lanes, Volumes, Timings
15: Union Blvd & Platte Ave

2043 Background
PM

Natural Cycle: 90

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.80

Intersection Signal Delay: 34.8

Intersection LOS: C

Intersection Capacity Utilization 80.4%

ICU Level of Service D

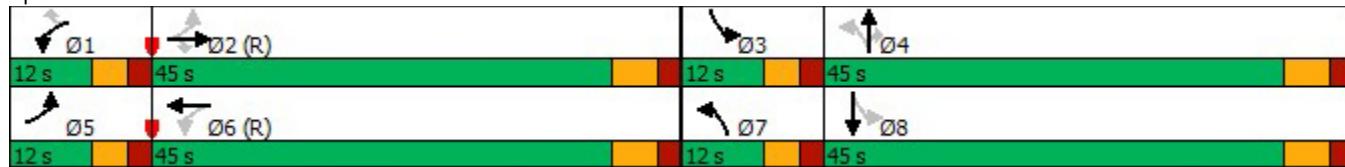

Analysis Period (min) 15

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 15: Union Blvd & Platte Ave

Intersection Summary

Area Type: Other

Cycle Length: 138

Actuated Cycle Length: 138

Offset: 72 (52%), Referenced to phase 2:EBTL and 6:WBTL, Start of Green

Natural Cycle: 65

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.49

Intersection Signal Delay: 21.4

Intersection LOS: C

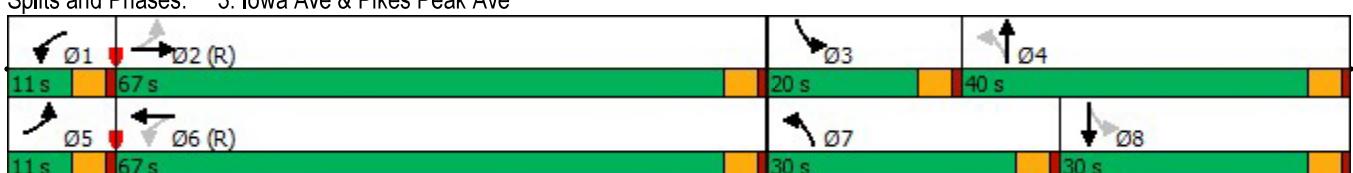

Intersection Capacity Utilization 53.7%

ICU Level of Service A

Analysis Period (min) 15

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 3: Iowa Ave & Pikes Peak Ave

Lanes, Volumes, Timings
4: Printers Pkwy & Pikes Peak Ave

Intersection Summary

Area Type: Other

Cycle Length: 114

Actuated Cycle Length: 114

Offset: 12 (11%), Referenced to phase 2:EBTL and 6:WBTL, Start of Green

Natural Cycle: 90

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.84

Intersection Signal Delay: 35.2

Intersection LOS: D

Intersection Capacity Utilization 81.1%

ICU Level of Service D

Analysis Period (min) 15

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 15: Union Blvd & Platte Ave

Lanes, Volumes, Timings
2: Bonfoy Ave & Pikes Peak Ave

Intersection Summary

Area Type: Other

Cycle Length: 138

Actuated Cycle Length: 138

Offset: 0 (0%), Referenced to phase 2:EBTL and 6:WBTL, Start of Yellow, Master Intersection

Natural Cycle: 85

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.96

Intersection Signal Delay: 45.8

Intersection LOS: D

Intersection Capacity Utilization 94.6%

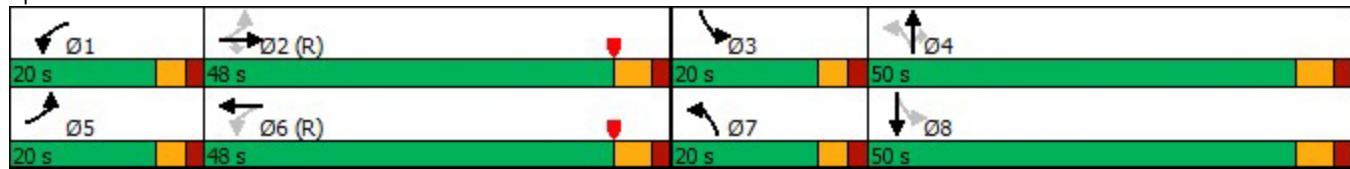

ICU Level of Service F

Analysis Period (min) 15

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.
m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 1: Union Blvd & Pikes Peak Ave

Lanes, Volumes, Timings
3: Iowa Ave & Pikes Peak Ave

Intersection Summary

Area Type: Other

Cycle Length: 138

Actuated Cycle Length: 138

Offset: 93 (67%), Referenced to phase 2:EBTL and 6:WBTL, Start of Green

Natural Cycle: 75

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.88

Intersection Signal Delay: 44.3 Intersection LOS: D

Intersection Capacity Utilization 81.6% ICU Level of Service D

Analysis Period (min) 15

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 15: Union Blvd & Platte Ave

Zone wide Queuing Penalty, Interval #3: 53

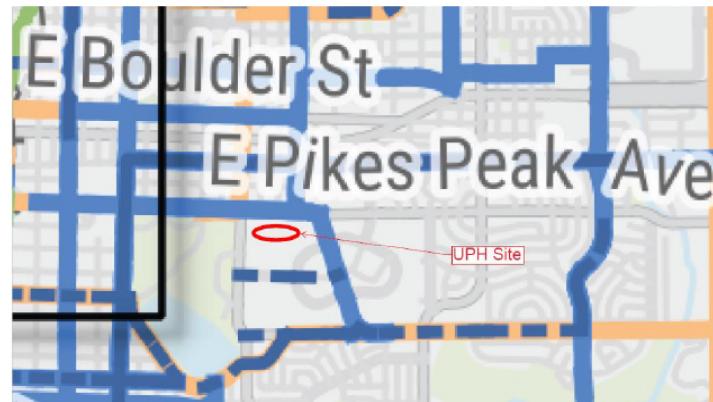

Zone wide Queuing Penalty, Interval #4: 60

Zone wide Queuing Penalty, All Intervals: 37

Appendix A – Bike Vision Network

Appendix __: Implementation of the Bike Vision Network on Pikes Peak Avenue.

City of Colorado Springs Bike Plan DRAFT

Vision Network

The bicycle Vision Network—a selection of streets in Colorado Springs on which to implement appropriate bicycle infrastructure—will improve connectivity and access to destinations across the city. Building upon existing trail and on-street facilities, the 379-mile Vision Network comprises 157 miles of recommended corridors identified as part of the 2015 PPACG Regional Non-motorized Plan, 19 miles of recommended facilities from the 2016 Experience Downtown Master Plan, and 203 new miles of recommended corridors from the COS Bikes! process.

This Plan does not make specific bicycle facility recommendations, but instead allows the City implementation flexibility as it completes COS Bikes! and builds out the bikeway network. The [Bicycle Facility Toolbox](#) provided in Appendix B should be used to make appropriate facility selection and design decisions for individual segments within the Vision Network.

Designing for “Interested but Concerned” and “Enthused and Confident” Bicyclists

“Interested but concerned” bicyclists prefer physical separation as traffic volumes and speeds increase. The bikeway facility selection chart below identifies bikeway facilities that improve operating environment for this bicyclist type at different roadway speeds and traffic volumes. The “enthused and confident” bicyclist will also prefer bikeway treatments noted in this chart. Selecting facility types based on this chart is recommended in order to serve the largest share of the population and increase bicycling in Colorado Springs.

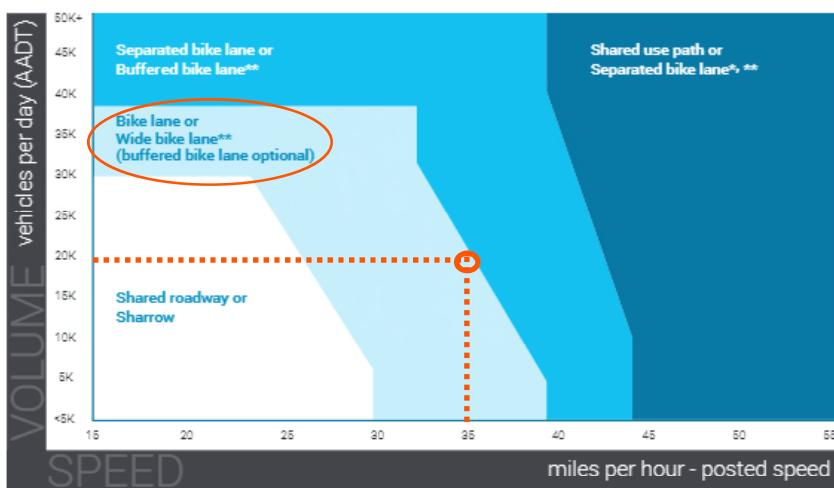

* To determine whether to provide a shared-use path, separated bike lane, or buffered bike lane, consider pedestrian and bicycle volumes or, in the absence of volume, consider land use.

** Can use a shoulder bikeway as necessary

Designing for “Strong and Fearless” Bicyclists

“Strong and fearless” bicyclists have a greater tolerance and willingness to operate with higher motor vehicle traffic volumes and speeds. The bikeway facility selection chart below identifies bikeway facilities that improve the operating environment for this bicyclist type at different roadway speeds and traffic volumes. The “enthused and confident” bicyclist may tolerate bikeway treatments based on this chart for limited distances, while “interested but concerned” bicyclists may not.

* To determine whether to provide a shared-use path, separated bike lane, or buffered bike lane, consider pedestrian and bicycle volumes or, in the absence of volume, consider land use.

** Can use a shoulder bikeway as necessary
